# Get Strong Customer Authentication and Verified Transaction Signatures with One Touch (or Smile)

MIRACL Trust® enables organizations to provide Strong Customer Authentication for web and mobile applications without sending, storing, or synchronizing any security-related information in whole form. Our cloud-based service provides a better customer experience by allowing users to independently demonstrate possession through a software token, and knowledge by providing the 4-digit PIN chosen during authorization.

- Meets "strong authentication" requirement for PSD2
- Does not send or store credentials in whole form at any time
- Allows application to be unlocked with fingerprint or face (iOS)
- Delivers verified digital signatures for financial transactions
- Improves customer onboarding (create PIN not password)
- Enables end user self-service support for PIN replacement

Try our multi-factor authentication banking demo for iOS devices with touch ID and transaction verification
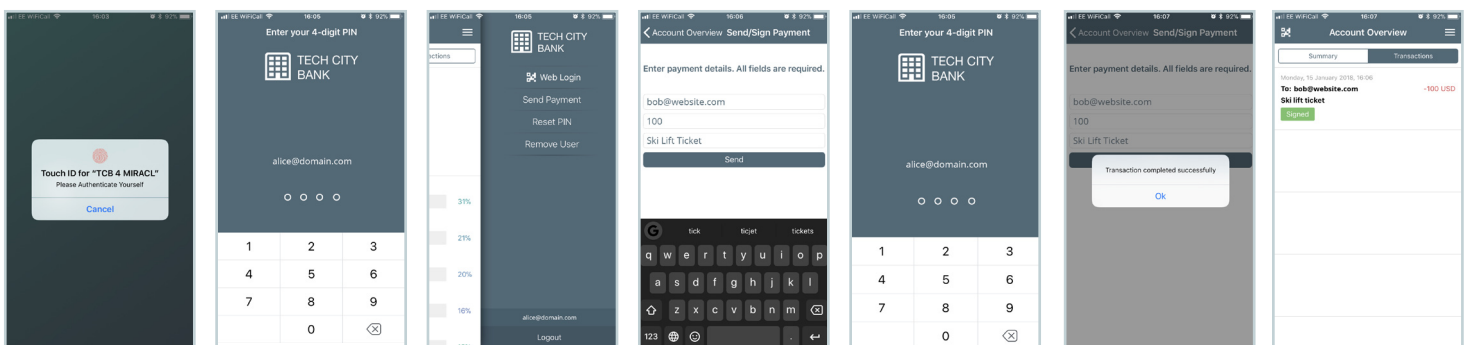

| Open app with finger or face | Sign in with PIN | Select "Send Payment" from menu | Enter payment details | Verify transaction with PIN | See payment confirmation | Reference approved payments |
